

Customer Journey Map

Project: Auto Ticket Classification using Flow Designer Team ID: SWTID-2026-7899

Journey	ENTICE	ENTER	ENGAGE	EXIT	EXTEND
Scenario	Employee identifies an IT issue and decides to raise an incident.	Employee opens the ServiceNow incident form.	Employee enters issue details and submits the incident; Flow Designer evaluates the ticket.	Employee receives confirmation/notification after submission and classification.	IT support reviews the classified incident and continues handling it.
Steps	Recognize technical problem	Access incident form	Enter short description and required details; submit ticket	View updated incident and notification	Support team reviews and works on ticket
Interactions	Employee notices issue and seeks support.	Uses ServiceNow portal/form.	Submits incident; automated flow checks keywords and updates category/subcategory according to configured rules.	Checks incident record and email notification, if configured.	Support staff reviews ticket classification and processes it.
Things / Digital touchpoints	Computer, affected application/device	ServiceNow incident form	Incident record, custom Incident Workflow table, Flow Designer	Incident record, email inbox	ServiceNow incident management workspace
Places	Workplace / remote work area	ServiceNow platform	ServiceNow platform	ServiceNow and email	IT support environment
People	Employee / requester	Employee / requester	Employee and automated workflow	Requester and IT support staff	IT support team
Goals & motivations	Help me identify where to report my issue.	Help me submit an incident with minimal effort.	Help me avoid manually deciding the correct category and subcategory.	Help me confirm my ticket was recorded and classified.	Help me get my issue reviewed by the appropriate support team.
Positive moments	A clear route to request IT help.	A structured form captures issue details.	Automatic rule-based classification reduces repetitive manual selection.	Ticket details and notification provide submission visibility.	Consistent classification can support organized ticket handling.
Negative moments	Employee may be unsure which support channel to use.	Category choices may be unclear.	Ambiguous descriptions or unmatched keywords may lead to incomplete or incorrect classification.	Employee may be uncertain what happens next if status details are limited.	Misclassification may require review or correction before routing.
Areas of opportunity	Make the incident entry point easy to find.	Use clear field labels and concise instructions.	Refine keyword rules, test varied descriptions, and provide a fallback for unmatched cases.	Show classification outcome and clear confirmation details; verify notification configuration.	Allow support staff to correct classification and use test feedback to improve rules.
